Abstract

The present invention relates to a method, a device and a system supporting an automated selection of data records for being provided by an identification means. The data records

5   comprising payment and electronic ticket related information. Obtained context information allow for selecting automatically one suitable data record out of said plurality of data records to be provided by the identification means, which operated for example as a radio frequency identification (RFID) transponder to an external identification means, which operated for example as a radio frequency reader (RFID) implemented for instance in a point of sales, a chsh

10   box and/or a ticket checkpoint.
